Save the Alewife Brook

Environmental Health is Community Health

October 30, 2026

To: United States Environmental Protection Agency, Massachusetts Department of Environmental Protection; Massachusetts Water Resources Authority; City of Cambridge; City of Somerville

From: Save the Alewife Brook

Re: Comments on the Draft Updated CSO Control Plan

Save the Alewife Brook submits the following comments on the Draft Updated CSO Control Plan dated April 30, 2026 (the Draft Plan). Part 1 lists points Save the Alewife Brook has raised since 2021 that the Draft Plan does not address. Parts 2, 3, and 4 address public health impacts, Alewife Brook flooding, and climate resiliency. Part 5 is our comment on the public process. Part 6 is our Petition and a list of Petition Signers and Supporters. Part 7 is our Community Sewage Elimination Plan.

In brief, the Draft Plan is inadequate because it will allow too many CSO activations and too much sewage in Alewife Brook in too many years. In fact, it will result in more CSO discharges into Alewife Brook during a 5-year storm in 2050 than the Brook currently receives in a 5-year storm. We agree with the City Councils of Boston, Cambridge, and Somerville, the elected officials of those cities, that the Draft is inadequate and that the new long-term control plan must achieve virtual elimination of CSOs: no CSOs up to a 25-year storm in a climate-projected year 2050. The new plan must commit to climate resilient sewer separation as envisioned by DEP policy and the Governor's Biodiversity Goals and not rely almost exclusively on storage for Alewife Brook CSOs, storage that is not climate resilient and does not include green stormwater infrastructure. It's time to finish the Boston Harbor clean-up and protect residents and the ecology, not shortchange them. That, and more, are discussed below.

Thank you for taking the time to read and consider our comments.

Sincerely,

Kristin Anderson, David White, David Stoff, Eugene Benson,
Ann McDonald, George Laite, Michael Lonetto, Eppa Rixey, Jennifer Wade

Save the Alewife Brook Steering Committee

Who we are:

Save the Alewife Brook is an inclusive and growing grassroots environmental and community health advocacy group with thousands of supporters in Cambridge, Somerville, Arlington, Belmont, Medford, and beyond. We are focused on addressing untreated sewage pollution and flooding problems associated with Alewife Brook.

Save the Alewife Brook formed in 2020, after noticing that the promise of improvements from the Boston Harbor Cleanup were not realized at Alewife Brook. Tens of millions of gallons of raw combined sewer overflow was being dumped into the brook annually, contrary to the faulty modeled results, which had projected improvement.[1]

For the last four years, we have met monthly with the Mystic River Watershed Association and the Charles River Watershed Association, to work together to advocate for CSO elimination in our waters. Everyone deserves clean water.

Introduction:

We are writing to oppose the Alewife Brook portion of the Draft Updated Long Term Combined Sewer Overflow Control Plan as proposed. The Final CSO Plan must eliminate CSO discharges to Alewife Brook up to the 2050 25-year storm. The Final Plan must employ technologies that are resilient to Climate Change. The $340 million recommended alternative for Alewife Brook, Alternative 3.AB Hybrid 2, fails to keep pace with Climate Change, resulting in a worsening of conditions. Because the plan's CSO control strategy is 99.9% storage and only 0.1% sewer separation, it is not resilient to Climate Change.[2] As a result, if this proposed plan were constructed, more raw sewage would be dumped into the Brook in a future 5-year storm event than in a present 5-year storm event. Storms smaller than the 5-year storm cause flooding that conveys harmful sewage to public parkland, the Greenway path, roads, homes, and commercial properties, and can make people sick. Alewife Brook runs through some of the most densely populated neighborhoods in Massachusetts, many of which are designated Environmental Justice blocks, with subsidized housing residents nearby.[3] In seeking the higher levels of investment needed to achieve greater storm resilience, fair and equitable funding mechanisms are needed to achieve CSO elimination, rather than being a barrier to it, while avoiding overwhelming low income residents with sewer rate increases.

Two of the brook's CSO outfalls fail to meet the levels of control MWRA committed to in federal court[4], meaning that they are in violation of the Harbor Court Case's Second Stipulation, MassDEP's Water Quality Variance, and the Federal Clean Water Act.

MWRA promised the public better conditions at Alewife Brook as a result of the Boston Harbor Cleanup projects. The confidence of the public in the Authority's solutions has been shattered as conditions at Alewife Brook have deteriorated over decades.

[4] Second Stipulation of the United States and the Massachusetts Water Resources Authority on Responsibility and Legal Liability for Combined Sewer Overflows, 2006, Exhibit B, paragraph 4. https://savethealewifebrook.org/wp-content/uploads/2026/02/Second_Stipulation_2006_ocr.pdf; MWRA, Supplement to the 2021 Final CSO Post Construction Case Boston Harbor Court Case, 1:85-cv-00489-RGS, Document 1979 Filed 07/17/26 by EPA, p. 5. https://drive.google.com/file/d/10n5ynWzzUMz_HsAkouNhNVFXF0dtxYva/view

What we ask to address the public health concerns at Alewife Brook:

1. Prioritize elimination of untreated CSOs in the Alewife Brook, the Charles River, and the Mystic River.
2. Eliminate CSO discharges to Alewife Brook up to a 2050 25-year storm.
3. Fund the Alewife Brook solution regionally through MWRA, State, and Federal Funding, and formally request that funding now.
4. Install on-site, real-time notification at each CSO outfall.
5. Provide support for community odor monitoring with a unified reporting requirement for the permittees.
6. Evaluate the conveyance capacity of the Alewife Brook channel under 2050 conditions, including continued sediment accumulation.
7. Publish the recommended plan's discharge, outfall by outfall, for the 2050 5-year, 2050 10-year, 2050 15-year, 2050 20-year, and 2050 25-year storms.
8. Evaluate the 2050 10-year, 15-year, and 20-year storms for Alewife Brook, with the expected discharge from each outfall.
9. Judge compliance by metered discharges, not modeled Typical Year predictions, and publish annual metered volumes and activations for all six Alewife Brook CSOs, including MWR003, in a single report.
10. Complete a public health assessment of sewage flooding along Alewife Brook, including impacts on Environmental Justice neighborhoods and unhoused residents.
11. Plan for the population that will live along the brook in 2050, including approved and projected development in the Alewife district.
12. Evaluate the use of the land around the brook that receives CSO discharges during flooding, reach a “sensitive use” designation for the land surrounding Alewife Brook, and require a higher level of control because of health impacts, environmental justice, and inequity.
13. Test the Final Plan against a planning horizon of at least year 2070.
14. Make sewer separation and green stormwater infrastructure the core of the plan, instead of storage tanks and a storage tunnel.
15. Reject any downgrade of Alewife Brook's Class B water quality standard.
16. Address the odor from CSO sediment exposed to open air during drought.
17. Guarantee a backup generator to keep the Sherman Street tank's odor control system running during power outages.
18. Include new stormwater wetlands on DCR land and explore the potential for more extensive, large-scale GSI as a means of restoring degraded wetlands and parkland in the former Great Swamp, including at least 3 acres at the Alewife T site, to clean and slow down separated stormwater.

19. Evaluate the effectiveness of 4:1 inflow and infiltration projects for new development before additional wastewater flows are added to the combined sewer system (314 CMR 12.00). Do not allow payment in lieu of I/I projects until the LTCP is complete.
20. Adopt the Alewife Brook Community CSO Plan, including its requirement that Green Stormwater Infrastructure manages 1 inch of rainfall from 10% of the impervious surfaces in the Cambridge and Somerville neighborhoods that drain to Alewife Brook.
21. Restore fish passage habitats to good health by 2040, reestablish river herring (Alewives) and other migratory fish to their historic ranges, and protect freshwater mussels.
22. Align the Final Plan with the Biodiversity Conservation Goals for the Commonwealth, which call on the state to “significantly reduce or eliminate combined-sewer overflows (CSOs).”
23. Evaluate downstream impacts of Alewife CSO discharges on the Mystic River and at the Paddle Boston canoe and kayak site.
24. Include an evaluation of sediment dredging and river restoration in the Final Plan, since federal Variance and Use Attain Ability regulations require an evaluation of these measures.
25. Form a partnership with the U.S. Army Corps of Engineers, together with DCR and MWRA. The partnership should develop a coordinated feasibility, design, permitting, funding, and implementation strategy for safe contaminated-sediment removal, dechannelization, restored flood capacity, river restoration, protected park access, and resilient transportation connections.
26. Install a water gage at Little River / Alewife.
27. Adopt a tiered rate structure and low-income subsidies so that the cost of the CSO work doesn't fall on low-income residents who can't afford it.
28. Have MWRA cover the costs of all legally required work to reach virtual elimination of CSOs, above the current proposed cost allocation.
29. Assess the health risks, including those from exposure to aerosolized bacteria, from CSO outfalls, accrued CSO sediment in the river, and storage tank venting.
30. Evaluate options for relocating or eliminating outfalls in sensitive areas, as federal law requires.
31. In the sensitive area determination, address documented impacts to water-contact activities including exposure to contaminated floodwaters; wetland, floodplain, and habitat functions; and documented endangered species and their habitat. (Table 13-2, sec 13-5, pg 513/566) If MassDEP and EPA decline to treat the area as sensitive, they should explain their factual and regulatory basis.

Part 1. Comments

Notification and Public Warning

Warnings on the flooded Greenway path and where people walk through floodwater to the Alewife T.

The plan includes no improved onsite real-time notification for overbank floodwater, even though it says floodwaters "would likely have high bacteria counts" (Plan p. 13-11, PDF p. 519).

People using the Alewife Greenway path and living near the Alewife require timely, clear warnings *when* CSOs are discharging into the brook, and for at least 48 hours afterwards (e.g., red light when discharging and for 24 hours after discharge ends, yellow light for 24-48 hours after discharge ends, and green light if no discharges for more than 48 hours).[5]

Sensitive Area Analysis

Evaluation of elimination or relocation of CSO outfalls.

CSO Policy requires a sensitive area analysis. That analysis must include an evaluation of elimination or relocation of outfalls. The plan provides none of the required analysis, even though it identifies the location of the MWR003 tank as a habitat for endangered species (Draft Plan, Table 13-2, sec. 13-5, pg. 513/566)

Odor

Odor from existing infrastructure, including the Greenway manholes, the Bicentennial Park siphon, and the CSO outfalls.

We are grateful to MassDEP for requiring that the CSO Permittees (MWRA, Cambridge, Somerville) monitor and develop an odor control feasibility study. However, there is no strategy in the Plan to address odors from existing sewer infrastructure. The Plan must include an odor control program. We support the inclusion of “sniff testing” in monthly maintenance reports. We also support increasing the frequency of outfall cleaning and believe Somerville should power wash outfall SOM001A after each discharge. We do not support any limitation on the time period for investigating odors as proposed by Cambridge. We believe odor controls are required by NMC #1 and must be included in any revision of the NPDES Permit or Variance.[6]

[5] City of Cambridge, Combined Sewer Overflow Real-Time Onsite Notification System Evaluation Report, August 29, 2025. https://savethealewifebrook.org/wp-content/uploads/2026/02/cam_csoplanning_realtimecsopublicnotificationevaluationreport_final20250829.pdf

[6] EPA, Combined Sewer Overflows: Guidance for Nine Minimum Controls, EPA 832-B-95-003, May 1995, listed at https://www.epa.gov/npdes/npdes-cso-guidance-documents

Odor from exposed CSO sediment during drought.

In the Plan, drought appears only in the public input table (Plan p. 5-17, PDF p. 129). No analysis of sediment odor.

We will see drought years, as well as rainy years. The Brook smells really bad during drought conditions, when the CSO sediment is exposed to open air. During the summer of 2022 drought, there were only a couple of inches of water above the sediment in places, and the stench was unbearable.

Odor control at the Sherman Street tank, and what happens to it in a power outage (backup generator).

The Plan lists "potential odor complaints" and public acceptance as implementation issues (Plan p. 12-41, PDF p. 503). There is no backup power included in the plan.

A tank filled with raw sewage in a residential neighborhood risks exposing residents, including schoolchildren and other members of vulnerable populations, to sewage smells and harmful aerosolized bacteria. The city has not offered any guarantee that in a major storm accompanied by power outages, a backup generator would be available to keep the tank's odor control system running. Tank neighbors want real solutions that will fix the problem, not a band-aid solution that maintains the status quo and guarantees continued CSO discharges into the Alewife Brook. The Sherman Street CSO tank prioritizes speed over long-term mitigation ability, which makes no sense given that CSO volume is expected to get larger over time.

Public Health

Illness after contact (norovirus, gastrointestinal illness, etc.), and E. coli at levels far above the swimming standard.

In the Plan's water quality model, public health is addressed only through a water-quality indicator of health risk, rather than fully assessing how people could be exposed to sewage and become ill. There is no health assessment, no illness data, and no exposure analysis.

Sewage at Alewife Brook is discharged untreated. E. coli counts run nearly 1,000 times above EPA's safe-contact level, and residents are exposed to live norovirus, intestinal worms, and other pathogens. People have testified that they have gotten sick from Alewife Brook CSOs.

Sewage pollution poses a serious health hazard to the 5,000 residents living in Alewife Brook's 100-year floodplain. There are documented cases of severe gastrointestinal illness after forced exposure to contaminated floodwaters.

Environmental Justice neighborhoods and unhoused residents living along the brook.

Alewife Brook sewage floodwater reaches the area's most diverse and vulnerable Environmental Justice neighborhoods, including unhoused residents, who may be turned away from emergency shelters. Unhoused residents camping near the outfalls in the Alewife Reservation are especially exposed. Camps get flooded out with riverine sewage floodwater and we have heard of unhoused

folks drinking water from Alewife Brook. Continuing CSO discharges here is an equity failure as well as a public health failure.

Aerosolized bacteria from tank venting and outfalls.

The Plan does not mention health risks from exposure to aerosolized bacteria.

A recent health study found a link between aerosolized CSO particulates and gastrointestinal disease[7]. Living near CSO outfalls or walking past them is shown to cause health problems severe enough to send residents to the Emergency Room. CSO discharges pose a higher health risk for people with weakened immune systems, including infants, elderly folks, and cancer patients.

Flooding

The 5,000 residents living in the floodplain today, with more housing planned.

The Plan does not provide population count data of existing or future people affected by Alewife Brook CSOs; nor is there an evaluation of sea-level rise and flooding.

Alewife Brook runs through Environmental Justice neighborhoods, past subsidized housing in Somerville, Arlington, and Cambridge. Roughly 5,000 residents of Arlington, Cambridge, and Belmont, many in Environmental Justice neighborhoods, live in the Alewife Brook 100-year floodplain.

Infrastructure

Stormwater wetlands on DCR land, including about 3 acres at the Alewife T site.

With the exception of an infeasible stormwater wetlands in Davis Square, which would require taking 40 private homes by eminent domain, there are no stormwater wetlands in the Plan. At CAM001, sites for stormwater attenuation are not identified (Plan p. 12-3, PDF p. 465).

Cambridge has ~200 acres of sewer separation work to do that is tributary to Alewife Brook. Sewer separation removes stormwater from the sewer pipes. After the stormwater is removed from the pipes, it has to go somewhere. That somewhere is a Stormwater Wetland, for cleaning and attenuation.[8]

There is space for large-scale Green Stormwater Infrastructure, including at least 3 acres for a stormwater wetlands. Nearby existing degraded wetlands could be evaluated and restored for green infrastructure. Marsh areas located across Rt. 2, such as those in the Mugar parcel or the former DCR Skating Rink are suitable sites.[9]

[7] Russell MC, Haley BM, Slawsky ED, et al., A Review of Combined Sewer Overflows and Gastrointestinal Illness in a Changing Climate, Current Epidemiology Reports (2025) 12:15, September 11, 2025. https://savethealewifebrook.org/wp-content/uploads/2026/07/s40471-025-00367-5.pdf

[9] MDC, 2003 Alewife Master Plan Map, South. https://savethealewifebrook.org/wp-content/uploads/2021/12/masterplansouth.pdf

No evaluation of projected wastewater from new developments such as Healthpeak and Quadrangle. No new sewer hook-ups before the construction of inflow offsets are completed.

The public asked that future conditions include population growth (Plan p. 5-17, PDF p. 129). The Plan's response covers climate only, and no population or new-development flow projections were found in the plan. Healthpeak and the Quadrangle are not mentioned. Further, Cambridge's recent zoning changes, allowing large multi-family dwellings anywhere in the city, will add even more sewage to an overburden combined sewer system draining to Alewife Brook.

Separated sewer pipes join combined sewers just before the flow hits the Alewife CSOs, meaning millions of gallons of sewage from massive new development will be dumped in the brook.

Evaluate the effectiveness of 4:1 inflow and infiltration projects for new development before additional wastewater flows are added to the combined sewer system (314 CMR 12.00). Do not allow payment in lieu of I/I projects until the ULTCP is complete.

With no plan for Virtual CSO Elimination, meaning a 2050 25-year level of control, we ask for a prohibition on new hook ups to the combined sewers in Cambridge and Somerville that contribute to the CSOs in Alewife Brook, as well as a prohibition on more than de minimis increases to current flows to those combined sewers.

The Alewife Community CSO Plan and the Coalition to End Sewage Pollution.

The Alewife Brook Community Combined Sewer Overflow Elimination Plan eliminates CSOs, reduces SSOs, reduces flooding, improves water quality, and can be funded by MWRA.

The Alewife Brook Community plan responds to the public health hazard of sewage flooding in the Alewife Brook area by proposing a feasible solution to virtually eliminate CSOs.[10] It integrates Cambridge's long-established CSO strategy at Alewife Brook with sewer separation and Green Stormwater Infrastructure. In Somerville, it incorporates six projects from the Somerville Citywide 2022 Flood Mitigation and Water Quality Improvements plan to reroute CSO to an existing CSO treatment facility and remove the SOM001A regulator. And, in Somerville, it includes 100 acres of sewer separation, as well as Green Stormwater Infrastructure. It proposes a large underground storage tank and Green Stormwater Infrastructure at the MBTA Alewife station for MWRA's Little River / Alewife Brook outfall (MWR003). The Community Plan requires, at a minimum, that Green Stormwater Infrastructure should be installed to manage 1-inch of rainfall from 10% of the impervious surfaces in Cambridge and Somerville neighborhoods that drain to Alewife Brook. New constructed stormwater wetlands would attenuate stormwater flows to reduce flooding, while reducing phosphorus in stormwater.

The Community Plan includes sewer separation, Green Stormwater Infrastructure, dredging & river restoration. It redirects CSO flow in Somerville, per the Dewberry 2022 Sewershed CA Alternative 2, while also including 100 acres of sewer separation in West Somerville. The addendum to the Community Plan includes input from the ULTCP planners, including stormwater conveyance and

[10] Save the Alewife Brook, Alewife Brook Community Combined Sewer Overflow (CSO) Elimination Plan, April 2026. https://savethealewifebrook.org/wp-content/uploads/2026/04/Alewife_Brook-Community-CSO-Elimination-Plan.pdf

updated cost estimates. The Community Plan is resilient to Climate Change and increases capacity of the local and regional sewer system by removing large volumes of stormwater.

Ecology and Restoration

Herring, mussels, and biodiversity.

Herring and carp are discussed in the Plan (Plan p. 13-11, PDF p. 519). Mussels are not mentioned.

Save the Alewife Brook found large freshwater mussel shells near the Brook.

In the Cambridge Day article, "Alewife Floaters, and what you can do about them," write Greg Harris writes, "Alewife Floaters are a species of freshwater mussel that as adults live embedded in the sand and mud, but as larvae have evolved an ingenious way to reach new areas of a river system: They hitch a ride in the gills of the Alewife herring (as well as related fish, such as the blue-back herring and the American shad). When its host fish were so abundant that they were a pillar of Massachusetts tribal sustenance, and fertilized soil for the early European colonists, the mussels must have been abundant, too. What does it do for a body of water to have such a species in it? Consider this: A single mussel can filter 15 to 20 gallons of water a day, capturing and cycling nutrients, structuring the stream bed as a habitat and forming the basis of a food web for other species. Mussel beds can revitalize an urban river."[11]

Restore fish passage habitats to good health by 2040. Nature-based solutions including Green Stormwater Infrastructure have immediate benefits to climate resilience. Reestablish river herring (Alewives) and other migratory fish to their historic ranges. Environmental health is community health.[12]

Governor Healey's Executive Order 618 and the Biodiversity Conservation Goals report.

The Plan does not mention Executive Order 618.[13]

The Governor's Biodiversity Conservation Goals for the Commonwealth Report, published in August 2025, specifically calls on the state–including, presumably, the MWRA and the EEA Secretary–to "significantly reduce or *eliminate combined-sewer overflows* (CSOs)."

The Existing Uses of Alewife Brook

The Plan cites the 2003 Metropolitan District Commission as background about the existing uses of Alewife Brook to support the change in Water Quality Standard.

> "Some potential remedies to these physical constraints were identified in the 2003 MDC Master Plan, including dredging of Alewife Brook and adjoining ponds, and restoring the stream bank. Much work has been done since 2003 on the bike paths and habitat restoration above the banks

[11] Greg Harris, "Alewife Floaters, and what you can do about them," Cambridge Day, November 23, 2023. https://www.cambridgeday.com/2023/11/23/alewife-floaters-and-what-you-can-do-about-them/

[12] Commonwealth of Massachusetts, Massachusetts Biodiversity Conservation Goals Report, 2025. https://www.mass.gov/doc/massachusetts-biodiversity-goals-report-2025/download

[13] Governor Maura Healey, Executive Order No. 618, Biodiversity Conservation in Massachusetts. https://www.mass.gov/executive-orders/no-618-biodiversity-conservation-in-massachusetts

> of Alewife Brook, and in 2024 DCR conducted a cleanup of debris and deadfalls in Alewife Brook between the Route 2 bridge and the Broadway bridge. However, significant dredging or restoration of the concrete sections of the stream bank has not taken place. *This work is not within the jurisdiction of the MWRA or the cities of Cambridge and Somerville to address and therefore could not be remedied by the Partners' CSO programs."*(Plan sec. 13-24, PDF p. 532).

Save the Alewife Brook strongly objects to the Authority's conclusion that an evaluation of direct restoration measures is outside of the scope of the long-term control plan. Federal law requires implementation of "cost-effective and reasonable best management practices for nonpoint source control" before a state removes an existing use (40 CFR § 131.10(h)(1) and(2)). The 2024 MassDEP Water Quality Variance requires information supporting the Use Attainability Analysis from the Partners.

Channelization and habitat degradation are categorized as non point source pollution. EPA offers extensive guidance on the topic.[14]

The MWRA's assertion that an evaluation of dredging and restoration measures is outside its jurisdiction is wide of the mark. The work itself may require cooperation with other agencies. Arguably an evaluation of these measures in the Plan is required by law.

COOPERATION WITH DCR

Twenty-three years ago, the MDC/DCR released the Alewife Reservation & Alewife Brook Master Plan, intended to improve the DCR-owned reservation and brook corridor. It envisioned restoring habitat, improving hydrological function, enhancing recreational and educational opportunities, and improving connections to other natural areas. Since then, a greenway and stormwater wetland were constructed, but climate change and widespread development have exacerbated both flooding and combined sewer overflow discharges of sewage into the brook.[15]

The ULTCP should look at river restoration, dechannelization, and dredging as envisaged in the 2003 Alewife Master Plan. It should also consider the recommendations in the EPA technical analysis. The scope should encompass Alewife Brook from Little River and wetland remnants of the former Great Swamp as they were in the 20203 Master Plan to the Alewife T Station to the Mystic River.

Downstream effects at Paddle Boston and the Mystic.

Paddle Boston appears only in a boat launch table in the Plan.

Alewife Brook flows into the Mystic River, just upstream of the Paddle Boston canoe and kayak rental site, impacting water quality and creating health hazards in an area frequented by boaters of all ages. Paddle Boston employees and amenities' users should be protected from untreated sewage.

[14] https://www.epa.gov/nps/nonpoint-source-hydromodification-and-habitat-alteration

[15] DCR, Alewife Master Plan, 2003, Findings and Recommendations. https://www.mass.gov/doc/findings-and-recommendations/download

Federal Funding.

The Plan includes no federal funding and no federal restoration partnership.

Save the Alewife Brook is working with Congresswoman Katherine Clark and our state and local delegations to address the sewage and flooding crisis. We ask that the Army Corps of Engineers is activated to dredge, dechannelize, and restore Alewife Brook. This would address the sediment and flooding crisis, which the LTCP does not.[16]

This work must be a part of the regional CSO-elimination effort. In 2022, EPA recommended in its comments on the ULTCP Scope document that MWRA dredge the Brook as part of the Long Term CSO Control Plan and work with DCR to remove sediment.[17]

In addition, Save the Alewife Brook is working to obtain federal funding for a water gage at Little River / Alewife.

Tiered rates and low-income subsidies.

The public asked for tiered rates for low-income residents (Plan p. 5-17, PDF p. 129). The plan defines customer assistance programs in its glossary (Plan PDF p. 28) but only runs financial capability assessments.

We need an equitable tiered-rate system for our sewer bills to help pay for solutions, so the cost burden doesn't fall on lower income residents who can least afford it. Clean water is a human right.

We ask that the CSO Permittees (MWRA, Cambridge, Somerville) explore the use of subsidies for low-income households or a tiered-rate system to cap cost increases for ratepayers who might struggle to pay higher rates. This is consistent with longstanding Environmental Justice principles that Environmental Justice communities should not bear the burden or costs of pollution that are beyond their control.[18]

Funding and MWRA enabling legislation.

In 1984, as a result of the Boston Harbor Cleanup Court Case, the Legislature created the Massachusetts Water Resources Authority to tackle the region's greatest environmental crisis – sewage pollution, sewer infrastructure failures, and decades of mismanagement. Under the glare of the national spotlight during the Bush vs. Dukakis campaign, and with the legal muscle of the Conservation Law Foundation and USEPA in federal and state courts, the state legislature created the MWRA. The Legislature empowered MWRA with a dedicated funding mechanism for infrastructure upgrades.

[16] Inter-Fluve Alewife Brook Sediment Study was conducted in May and June of 2024. https://savethealewifebrook.org/wp-content/uploads/2026/08/2024_AlewifeBrookSedimentStudyReport_FINAL_Inter-Fluve-w-comment-compressed.pdf

[17] EPA, Comments on MWRA's Draft Scope of Work for the Updated CSO Control Plan, May 11, 2022. https://savethealewifebrook.org/wp-content/uploads/2022/05/EPA-Comments-on-MWRA-CSO-Control-Plan-SOW.pdf

[18] EPA, Clean Water Act Financial Capability Assessment Guidance, 2023. https://www.epa.gov/system/files/documents/2023-01/cwa-financial-capability-assessment-guidance.pdf

The MWRA Enabling Act of 1984[19] mandates the "repair, replacement, rehabilitation, modernization and extension" of the sewer system, "in the best interests of the commonwealth and its inhabitants, to promote the general health and welfare, to improve commerce and living conditions of the citizenry."

Through borrowing backed by water and sewer system revenues, with rate increases throughout the 1980s and 90s, the MWRA raised $5 billion, funding the construction of the Deer Island Treatment Plant and reducing combined sewer overflows.

MWRA uses its revenue to back long-term bonds to fund sewer system upgrades at more favorable interest rates than cities, Massachusetts, or even the federal government. Decades ago, MWRA issued billions of dollars in bonds to pay for the Harbor Cleanup CSO projects and the Deer Island treatment plant. Those bonds are now expiring, meaning they are paid off. In the next ten years, MWRA has the capacity to issue another $2.1 billion in bonds. MWRA's revenue remains the same, steadily increasing by 3% annually. MWRA's budget already exists for the debt service on new bonds. Thus, there will be no huge shock to the ratepayers on their sewer bills.[20]

Part 2. Public Health Impacts

Living near CSOs is a public health risk.

Emerging science from researchers at the BU School of Public Health shows that living near CSOs can cause adverse health impacts severe enough to send people to the Emergency Room. A recent review of eight epidemiological studies of the impacts of CSOs on community health points to inhalation of aerosolized particulates as a contributing factor. Just breathing air near CSOs is thought to be enough to make people sick.

The Massachusetts Evidence

1. In Massachusetts municipalities bordering a CSO-impacted river, the largest CSO events were followed by a measurable rise in emergency department visits for acute gastrointestinal illness within four days.[21]
2. Following 99th percentile CSO events, the cumulative risk ratio for acute gastrointestinal illness was 1.62, with a 95% confidence interval of 1.04 to 2.51. That is a 62% higher risk of an emergency department visit for gastrointestinal illness.
3. Across all extreme upstream CSO discharge events, the cumulative risk ratio was 1.22, with a 95% confidence interval of 1.05 to 1.42.
4. The increase in illness after the largest CSO events held regardless of whether a municipality drew its drinking water from the CSO-impacted river. Drinking water contamination does not explain the harm.
5. A 2025 peer-reviewed review of the literature found eight epidemiological studies of CSOs and gastrointestinal illness across Europe and North America, spanning study years 2002 to 2019, and reported that the included studies showed evidence of a positive association between CSOs and GI illness.[22]
6. The same review found that ten times more sewage was present in a receiving waterbody when a CSO event occurred at the same time as a heavy rain event than when heavy rain occurred without a CSO.
7. The review also found that the number of annual extreme precipitation days in the Northeast increased by approximately 60% from 1958 to 2021 and is expected to increase further. More extreme rain means more CSO discharges.

Sworn Testimony of Dr. Beth M. Haley

> " There are three commonly accepted possible exposure pathways to pathogens from CSO discharges. The most well-supported of these is incidental ingestion while recreating. Some studies have also found a link to AGI from drinking water drawn from CSO waters, and there is emerging ***research on the potential for aerosolized contaminated water to cause illness*** when inhaled.
>
> Because only the most extreme cases go to the emergency room, it is difficult to measure the extent of AGI from CSO discharges. It is likely that many cases go unreported, although they are still likely to disrupt people's lives.
>
> ***Fecal contamination from CSOs presents unique public health risks that stormwater runoff does not.*** Fecal pathogens are a known, direct, and acute risk to human health. Sewage discharge also contains higher levels of PFAS, anti-microbial bacteria, and pharmaceuticals than stormwater runoff alone. These risks are present even at low discharge volumes.
>
> If CSOs are not reduced and eliminated, they will continue to pose acute public health risks, particularly as increased precipitation from climate change causes these events to occur more frequently and at larger volumes."

Affidavit of Beth M. Haley, PhD, Environmental Health, Boston University, executed July 9, 2026, paragraphs 6, 7, 9, and 10.[23]

Part 3. Alewife Brook Riverine Flooding

Alewife Brook Flooding in 2023

Flooding is bad enough. Sewage flooding is many times worse and a serious health hazard.

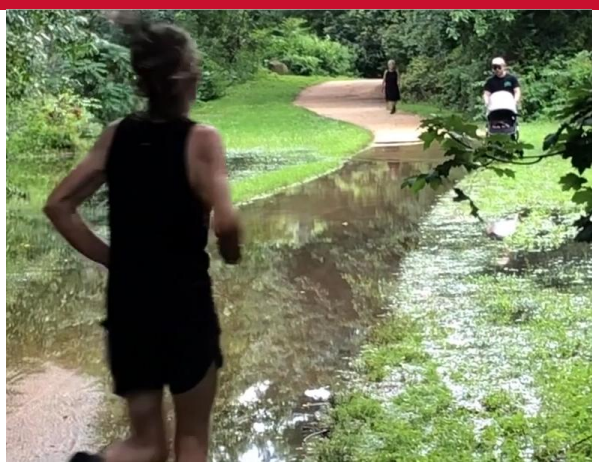

There is a long history of Alewife Brook flooding during rain storms.[24] Alewife Brook flooding occurs because of its topography and because of urbanization. The area is relatively flat and has been heavily developed with impervious surfaces like pavement and buildings. This results in a reduction of natural flood storage.

The urban stormwater drainage system is designed to handle limited, small-size storms.[25] When we get larger or more intense storms, there is flooding.

When Alewife Brook floods, there is likely untreated sewage in the floodwater.

A child riding her bike through Alewife sewage flood water on 9/19/2023. Photo by Ann McDonald.

August 8th, 2023: Area residents jogged and pushed baby strollers through sewage floodwater on the Alewife Greenway. Photo by David Stoff.

[25]Cambridge DPW Stormwater Guidelines 2006.

2023 Flood Events

We have documented that Alewife Brook flooded at least 5 times in 2023. It is possible that more flooding occurred. But based on photographic evidence[26] and confirmed with USGS water gage data,[27] we know of at least 5 times.

In these 2023 storms, sewage-contaminated flood water covered parts of the Alewife Greenway. The Greenway is a popular multi-use path on State Parkland for walkers, joggers, and cyclists. The Alewife Greenway connects residents from Somerville, Medford, Cambridge, and Arlington to the Alewife MBTA Station and the Minuteman Bikeway.

USGS Water Gage Data and Rainfall in 2023

The table below shows the 5 flooding events in 2023 that were documented with photos and gage data. There were also documented CSO sewage discharges on each of these flood dates. According to the MWRA, in 2023, over 29 million gallons of CSO sewage were discharged into Alewife Brook.[28]

Flooding Date	Max Water Height (feet)	Max Water Flow (cfs)	Daily Rainfall (in)
Mar 13-14	3.54	94.80	2.54
Aug 8	4.10	149.25	1.33
Sep 18-19	3.81	103.83	1.52
Dec 11	3.26	93.83	1.75
Dec 18	3.60	108.75	1.68

Daily values do not fully capture rainfall intensity.

[27]Broadway Bridge Gage Data, thanks to the Tri-Community Flood Group: Alewife Brook Near Arlington, MA, 01103025. https://waterdata.usgs.gov/monitoring-location/01103025/

[28]MWRA CSO Annual Report 2023, Table 2-3.

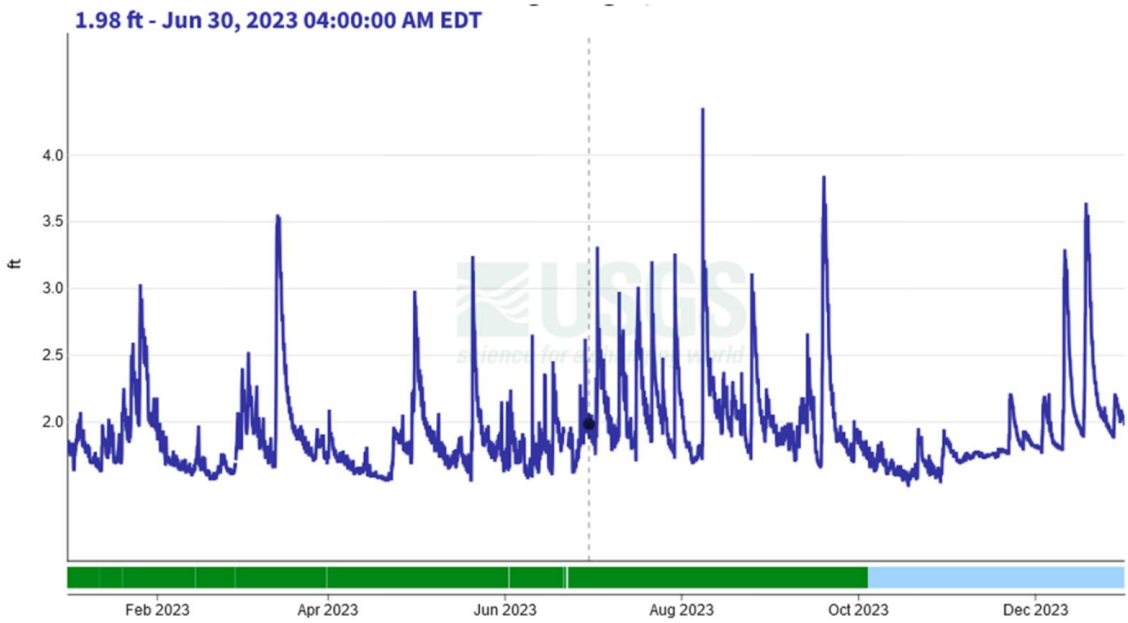

What level of storm caused this flooding?

The daily rainfall on all five documented 2023 flood dates ranged from 1.33 to 2.54 inches. For comparison, NOAA Atlas 14 puts the Boston 1-year, 24-hour storm at 2.53 inches and the 2-year, 24-hour storm at 3.14 inches.[29]

Not one of these events reached even a 2-year storm, and four of the five were well below a 1-year storm. Alewife Brook flooded with sewage in the floodwater at rainfall levels that occur multiple times a year.

2023 Broadway Bridge USGS Gage Data

Thanks to the Tri-Community Flood Group, we have a USGS water gage at the Broadway Bridge: Alewife Brook Near Arlington, MA, 01103025.

Part 4. Climate Resiliency: Storage Is Not the Solution

The Draft ULTCP is inadequate and does not keep up with Climate Change.

The Draft Plan is designed so that even after after $340 million is spent on Alewife Brook CSO control, a single, common 2050 5-year storm will still discharge **15.6 million gallons** of untreated sewage and stormwater into Alewife Brook.

According to MWRA's Unified Typical Year Model, a 5-year storm under baseline conditions today discharges 10.53 million gallons into the Brook.[30] The Draft Plan therefore leaves Alewife Brook receiving nearly **50% more** CSO volume in a common future 5-year storm than it receives today. The Draft Plan does not keep up with climate change.

MWRA's own baseline for a 2050 5-year storm at Alewife Brook is 20.9 million gallons. The Plan proposes 5.3 million gallons[31] of new storage against it, capturing roughly one quarter of the volume and leaving 15.6 million gallons of CSO in the Brook.

[30]Source: MWRA's December 2022 Alewife Brook and Lower Charles River System Optimization Evaluations Report, Table 1-2. https://www.mwra.com/sites/default/files/2024-08/Alewife Brook and Charles River System Optimization Evaluations report 2022.pdf

[31]Source: MWRA, Massachusetts Water Resources Authority, City of Cambridge and City of Somerville, Draft Updated Combined Sewer Overflow Control Plan, submitted to the Massachusetts Department of Environmental Protection April 30, 2026, Table 10-21, page 10-25. https://savethealewifebrook.org/wp-content/uploads/2026/07/DraftUpdatedCSOControlPlan_4_30_2026.pdf

Table 1. Baseline CSO Discharge to Alewife Brook, by Outfall

What this table shows: MWRA's modeled discharge from each of the six Alewife Brook outfalls under baseline conditions. Read the right-hand pair of columns, headed "5-Year, 24-hour Storm." The six outfalls sum to 10.53 MG. This is the present-day starting point against which the Draft Plan must be measured. "Future Conditions Baseline" is MWRA's label for conditions after .

Table 1-2. Predicted Annual CSO Activation Frequency and Volume for the Future Conditions Baseline: Typical Year, and 2-year and 5-year, 24-hour Storms

Outfall	Regulator	Future Conditions Baseline					
		Typical Year		2-Year, 24-hour Storm		5-Year, 24-hour Storm	
		Activation Frequency	Volume (MG)	Activation Frequency	Volume (MG)	Activation Frequency	Volume (MG)
Alewife Brook							
CAM001	RE-011	1	0.02	1	0.07	1	0.10
CAM002	RE-021	0	0.00	0	0.00	1	0.09
MWR003	RE-031	3	0.61	1	1.51	1	3.03
CAM401A	RE-401	5	0.66	1	1.36	1	2.16
CAM401B	RE-401B	4	0.50	1	0.71	1	0.99
SOM001A	RE-01A	8	4.47	1	2.78	1	4.16
SUM		8 (max)	6.26		6.43		**10.53**

MWRA's December 2022 Alewife Brook and Lower Charles River System Optimization Evaluations Report, Table 1-2.

Table 2. CSO Volume at Alewife Brook Before Any New Storage Is Built

What this table shows: The volume MWRA projects for each design storm under baseline conditions, before the Draft Plan's storage is subtracted. In the Alewife Brook row: 20.9 MG in a 2050 5-year storm. "LOC" means Level of Control, the discharge target the Plan is designed to meet.

Table 10-21. Total Regional CSO Volume by Waterbody for Each LOC under Baseline Conditions

Waterbody	Largest Storm in 2050 TY(1) CSO Volume	2050 5-Year LOC(2) CSO Volume	2050 25-Year LOC(3) CSO Volume
Alewife Brook	4.8 MG	20.9 MG	40.1 MG
Mystic River	10.5 MG	17.4 MG	27.2 MG
Charles River	16.6 MG	65.6 MG	120.6 MG

Notes:

(1) Largest storm in the 2050 TY is 3.3 inches of rainfall in 21 hours

(2) 2050 5-year storm is 5.3 inches of rainfall in 24 hours

(3) 2050 25-year storm is 7.8 inches of rainfall in 24 hours

Draft Updated CSO Control Plan, dated April 30, 2026, Table 10-21, page 10-25.

How the 15.6 Million Gallon Figure Is Derived

1. MWRA baseline volume, Alewife Brook, 2050 5-year storm: 20.9 MG (Table 2 above)
2. New storage proposed in the Draft Plan: 5.3 MG total, in three separate structures
   a. 1.5 MG storage tank at CAM401A, Sherman Street, Cambridge[32]
   b. 1.5 MG storage tank at MWR003, Cambridge
   c. 2.3 MG microtunneled storage conduit, 9-foot internal diameter, approximately 5,400 feet, serving CAM401B and SOM001A[33]
3. 1.5 MG + 1.5 MG + 2.3 MG = 5.3 MG storage capacity
4. Discharge remaining after the Plan is built: 20.9 − 5.3 = 15.6 MG

Result: the Draft Plan captures 25% of the 2050 5-year storm volume and discharges the remaining 15.6 MG into a Class B water. Measured against today's 10.53 MG, that is an increase of about 48%.

A note on the two storms. The 10.53 MG figure is a 5-year storm under today's rainfall. The 15.6 MG figure is a 5-year storm in 2050, which the Plan defines as 5.3 inches of rain in 24 hours. The rainfall depths are different because that is precisely the point: the 5-year storm grows, and the Plan is not sized to keep pace with it. The Plan defines the 2050 25-year storm as 7.8 inches in 24 hours.

Same 2.3 MG capacity stated in the alternatives analysis at Chapter 9, Section 9.5.3.1, "Component Descriptions," printed page 9-52, and Table 9-25, "Alternative 3.AB Hybrid 2 (0 CSOs in 2050 TY) Summary," printed page 9-51.

Photo of Alewife Stormwater Wetlands by Eppa Rixey.

The Climate Resilient solution:
Sewer separation paired with Green Stormwater Infrastructure.

Sewer separation reduces CSOs, SSOs, basement backups, localized flooding, and blended events. By removing large volumes of stormwater, sewer separation increases local and regional sewer system capacity. It is the climate-resilient strategy for combined sewer systems.

Under the first Alewife Brook Long-Term CSO Control Plan, half the CSO outfall regulators were eliminated, Cambridge separated 283 acres of combined sewers, and the 3.4-acre Alewife Stormwater Wetland was created. Half the work in Cambridge is done. The city should not give up and allow a worsening of conditions.

Under the Draft plan, none of the remaining 6 CSO outfall regulators are removed and less than 1% of the CSO control is through sewer separation. This approach does nothing to address future capacity problems due to larger and more severe storm events.

Part 5. Public Process: Comments on the public process, including historical context

Alternatives-analysis gap: inadequate evaluation of hybrid solutions at higher levels of CSO control.

Note that because the planners chose to focus on minimal levels of control, the proposed plans for 5 and 25 year level of control at Alewife brook are unrealistic, consisting only of bigger tanks and tunnels or “complete” sewer separation and ignoring other options. This ignores further hybrid solutions such as targeted sewer separation and GSI for stormwater management. Additional planning effort is needed to fill this gap. As the public does not have access to the internal discussions between the planning team and their consultants we cannot know if this is intentional, but limiting plans as a means of power (by limiting scope) has been noted as a strategy for one of the partners. This lack of ambition and vision in defining options for achieving higher levels of control led Save the Alewife Brook to develop an alternative plan for the Alewife watershed, as noted in Part 7.

Climate change modeling.

We would like to thank the City of Cambridge for working hard to incorporate future climate data in the model used for infrastructure planning.[34]

Public input.

The Updated Long Term CSO Control Plan public process has been weighted against including meaningful public input. Save the Alewife Brook, along with the Mystic and Charles River Watershed Associations, were effective at turning out the public to the recorded public CSO meetings. However, with the exception of the first CSO meeting, which was expertly hosted by the City of Cambridge, the public was largely silenced, barely allowed to speak, or ask questions. When the public was given the opportunity to weigh in, the overwhelming feedback was a request to address public health impacts of CSOs from Alewife Brook flooding, to include large Green Stormwater Infrastructure, and to end untreated CSOs. The Draft Plan fails to include this feedback.

[34] City of Cambridge, CSO Future Typical Year Analysis. https://savethealewifebrook.org/wp-content/uploads/2023/12/Future_Typical_Year_Analysis.pdf

The engineers.

We thank the engineers, and civil servants who have put so much time into engagement over the last four plus years. In particular, we are grateful to Brian Kubaska, Jeremy Hall, David Wu, Chris Goodwin, Jim Wilcox, Lucica Hiller, Gina Cortese, Stephanie Alimena, and Rich Raiche. We also thank the consultants from AECOM, Stantec, Weston & Sampson, Dewberry, in particular: Don Walker, Erika Casarano, Dr. Indrani Ghosh, and David Van Hoven.

Elected Officials: local, state, and federal.

We are grateful to our elected officials who have stepped up to support residents impacted by CSOs.

The City Council of Cambridge (Patty Nolan, Burhan Azeem, Sumbul Siddiqui, Jivan Sobrinho-Wheeler, Ayah Al-Zubi, Marc McGovern, Tim Flaherty, Denise Simmons, & Cathie Zusy) voted for Virtual CSO Elimination.[35]

The City Council of Somerville (Emily Hardt, Will Mbah, Jon Link, Lance Davis, Ben Ewen-Campen, Matt McLaughlin, Naima Sait, Jesse Clingan, & J.T. Scott - with support in the past from Kristen Strezo) voted to oppose the Draft Plan and for Virtual CSO Elimination.[36]

The City Council of Boston (Liz Breadon, Brian Worrell, Henry Santana, Enrique Pepén, Erin Murphy, Ruthzee Louijeune, Ed Flynn, John FitzGerald, Miniard Culpepper, & Gabriela Coletta Zapata) These Councilors have voted to oppose the Draft Plan and voted for 25-year level of CSO control.[37]

Arlington Town Hall has spoken up. The Arlington Select Board - Diane Mahon, Steve DeCourcey, John Hurd, Eric Helmuth, and Joe Solomon - opposes the Draft Plan and asks for an end to dumping sewage in the brook.[38]

We are grateful for support from Congresswoman Katherine Clark, Governor Maura Healey, State Senators Pat Jehlen, Cindy Friedman, Will Brownsberger, Cynthia Stone Creem, Rebecca Rausch, Lydia Edwards, Nick Collins, Sal N. DiDomenico, & Bruce E. Tarr, and State Representatives Dave Rogers, Steve Owens, Sean Garballey, Christine Barber, Marjorie Decker, Greg Schwartz, Mike Connelly, Erika Uyterhoeven, Kevin Honan, John Lawn, David Paul Linsky, Jay Livingstone, Paul McMurtry, Samantha Montaño, John Moran, Michael Moran, Alice Hanlon Peisch, Amy Sangiolo, Thomas Stanley, Tommy Vitolo, Adrian Madaro, Judith Garcia, Randy Mom, & Daniel Cahill.

[38] Town of Arlington Select Board, letter to MWRA, September 30, 2026. https://savethealewifebrook.org/wp-content/uploads/2026/10/Arlington_public_comment_letter.pdf

Regulators: MassDEP and EPA.

We also recognize the amazing work of the regulators. Thank you to the EPA's Todd Borci, Ken Moraff, Jeff Kopf, Dan Arsenault, & Michael Wagner. The ULTCP is a requirement of MassDEP's Water Quality Variance. Thank you to Bonnie Heiple, Kathleen Baskin, Susy King, Lealdon Langley, Kevin Brander, Eric Worrall, Cathy Coniaris, & David Boyer.

We ask MassDEP and EPA to recognize that they must use their power now, to require a 2050 25-year level of CSO control through the most climate-resilient CSO control strategies: sewer separation that is paired with large green stormwater infrastructure. Without the help of MassDEP and EPA, there will not be an equitable solution at Alewife Brook. Please help us.

The Authority.

We thank Secretary Rebecca Tepper, Chair of the MWRA Board of Directors, for requesting that MWRA provide ratepayer funding data. Without this information, it was impossible to assess financial impacts on ratepaying households who will ultimately pay for the Plan.

The MWRA plays a major role in the ULTCP, as well as in the process of completing the promises and legal requirements of the Boston Harbor Cleanup Court Case. MWRA's approach to its work of fulfilling its obligations to the public as mandated in the Legislature's MWRA Enabling Act can best be described as "kicking and screaming, while digging its heels into the ground," effectively impeding progress.

After four decades, the landmark Boston Harbor Cleanup court case is still active because MWRA has not met its obligations. At least eight CSO outfalls are out of compliance with the court[39], out of compliance with the Water Quality Variance, and out of compliance with the Clean Water Act. Of those eight outfalls, two are located at Alewife Brook. This is after more than 11 years after completion of the construction projects of the Boston Harbor cleanup's Long-Term CSO Control Plan.[40]

In 2024, BWSC joined a Supreme Court challenge that narrowed Clean Water Act water-quality protections.[41] MWRA cited that ruling in September 2026, in an effort to reduce its Boston Harbor CSO obligations.[42] MWRA is using ratepayer money to pay its legal firm Foley Hoag LLP $990 per hour to fight against reducing dumping sewage into public waters.[43]

[42] Reply in Support of Massachusetts Water Resources Authority's Motion for Final Determinations Under the Second Stipulation at 16 n.17, United States v. Metropolitan District Commission, No. 85-cv-00489-RGS, Dkt. No. 1985 (D. Mass. Sept. 11, 2026).

[43] MWRA Board of Directors, Vote Extracts, January 14, 2026, Legal Services Furnished by Special Assistant Attorney General Jonathan Ettinger/Foley Hoag LLP in the Boston Harbor Case. https://www.mwra.com/media/file/2026-01-14-mwra-board-directors-vote-extractsmwra

In May 2026, MWRA filed a motion asking the court to declare that MWRA had no further obligation to meet the court's CSO requirements.[44] The Federal Government, the EPA, MassDEP, and Conservation Law Foundation pushed back heavily against relieving MWRA of its CSO obligations.[45]

Fund the ULTCP first, before other wastewater projects.

The Updated Long-Term Control Plan itself is more than 4 years behind schedule, as it was supposed to be finalized by 12/31/2023.[46] The ULTCP is a legal requirement and because it is overdue, it should have first claim on available MWRA wastewater funding. Yet between FY 2024 and 2028, MWRA plans to spend $1 billion on other wastewater projects.

Every sewer community in the MWRA's district sends its sewage to Deer Island Wastewater Treatment Plan. So no municipality objects to paying for it. Funding improvements at Deer Island first, before funding the CSO Plan, sets up a political fight over funding between the sewer communities.

CSOs are a Regional Problem of a Connected Sewer System.

MWRA owns aging regional sewer system infrastructure which ties Cambridge and Somerville to MWRA's regional system at Alewife Brook. MWRA's infrastructure at Alewife Brook includes two large "interceptor" pipes built in 1896 and 1948. Those interceptors are connected to all six Alewife Brook CSO outfalls, as well as the Alewife Brook Pump Station. The Alewife Brook Pump Station is the oldest operating pump station in the MWRA's system.

Stormwater in the combined systems regularly overload the MWRA's sewer system during wet weather storm events, sometimes when the area gets less than an inch of hard rain. At MWRA's February 22, 2022, public briefing to discuss the Final Combined Sewer Overflow Performance Report, MWRA's consultant from AECOM stated, "The MWRA system is limited by downstream capacity. Under very large storm events, the capacity of the Alewife Brook Pump Station, which is downstream of [MWR003] is reaching capacity - very large facility, has 90 million gallons per day capacity. That then discharges into sewers conveying flow further downstream and going to the Chelsea Creek Headworks, that then reaches capacity. And there are events when the capacity of our Deer Island treatment plant, 1.2 / 1.3 billion gallons per day, is reached. So there are limits to what the MWRA can push through the system."

The regional sewer system simply cannot move the stormwater in the system during many storms. Raw sewage mixed with stormwater from Cambridge and Somerville discharges into Alewife Brook because it has nowhere else to go. Sewer separation would remove large volumes of stormwater from the system, which would increase system capacity at Deer Island Wastewater Treatment Plant.

Part 6. Save the Alewife Brook Petition, Signers & Supporters.

In October 2021, Save the Alewife Brook published the following petition and began collecting signatures on it, asking for what is provided under the federal Clean Water Act and State Law for Alewife Brook, as a Class B waterbody.

Email Petition to End Alewife Brook Sewage Pollution:

We demand the following:

- Elimination of all Combined Sewer Overflows (CSOs) to End Sewage Pollution
- Separated Sewer Systems to keep Sewage out of Stormwater
- A Safe, Beautiful, Fishable Brook for the Residents and for Wildlife
- New Green Infrastructure on State Land for Stormwater Cleaning
- New Grey Infrastructure to Reduce Flooding in the Face of Climate Change

During some major storm events, the Alewife Brook floods into the parks, yards, and houses of area residents in Environmental Justice Communities. The flood water contains hazardous sewage that is discharged from the active CSOs owned by Cambridge, Somerville, and the MWRA. Climate change, with its wetter rainy seasons, more intense storms, and sea level rise, is expected to increase the severity and frequency of these events.

Furthermore, the MWRA's sewer infrastructure is failing to meet capacity during many rain events, causing hazardous sewage pollution discharges. In fact, the rate of sewage discharge is increasing exponentially with increase in rainwater, making this a Climate Change Emergency.

Therefore, we demand that the cities of Cambridge, Somerville, and the MWRA completely stop discharging sewage pollution into the Alewife Brook. We also demand that the Commonwealth of Massachusetts invest in urgently needed improvements to the Amelia Earhart Dam and to the Draw Seven Park along the Mystic River so the area is resilient to the effects of flooding due to Climate Change.

Part 6. The Alewife Brook Community Combined Sewer Overflow (CSO) Elimination Plan & Addendum

Due to the file size of the Community Plan document, please download it from here: https://savethealewifebrook.org/wp-content/uploads/2026/04/Alewife_Brook-Community-CSO-Elimination-Plan.pdf

Alewife Brook Community CSO Elimination Plan

ADDENDUM

Incorporating MWRA, Cambridge & Somerville
Project Planner Feedback: July 2026

View of the Alewife stormwater wetland. Photo: Stantec.

Prepared for MWRA Executive Director
Stephen Estes-Smargiassi

This Addendum is an update to the Alewife Brook Community CSO Elimination Plan (last updated 04/21/2026) for our meeting with the MWRA's Executive Director on July 22, 2026.

This document incorporates feedback from the June 10, 2026, session with CSO Project Planners from MWRA, Cambridge, and Somerville, and should be read alongside the full Community Plan.

www.savethealewifebrook.org

Addendum last updated: 07/21/2026

ADDENDUM INTRODUCTION

This Addendum updates the Community Plan following the **June 10, 2026,** meeting with Save the Alewife Brook, Mystic River Watershed Association, and the CSO Project Planners from MWRA, Cambridge, & Somerville (collectively, the "Project Partners") to review the Community Plan in detail. This Addendum incorporates the feedback and refinements that came out of that meeting, updating and highlighting six elements of the Community Plan:

- ✓ **Cost**: adopting the Project Partners' own unit-cost calculations, bringing the total estimated cost of the Community Plan to approximately **$700 million** (Section 1).
- ✓ **Added stormwater conveyance pipes** linking the separated sewersheds, consolidated pumping, and the new constructed wetlands (Section 2).
- ✓ **Sewer separation in Somerville and rerouting CSO from SOM001A** to an existing CSO treatment facility (Section 3).
- ✓ **Legal and Policy Basis** for the Alewife Brook Community CSO Plan (Section 4).

Further, we are exploring these options and will ask the Project Partners for input:

- ✓ **Connecting the fully separated CAM401A sewershed to the MWR003 storage tank** at the MBTA Station, responding to the Project Partners' concern that sewer separation alone captures only about 90% of stormwater because of infiltration and inflow (I/I) (Section 5).
- ✓ **Right-sizing the MBTA Station storage tank** to meet a 25-year level of control for both the separated CAM401A flow and MWR003 (Section 6).

This Addendum should be read together with the Community Plan, which it does not replace. It also adds a new legal and policy basis for the Community Plan, together with recent public engagement results (Section 4).

Cost, conveyance, tank sizing, and Somerville routing updates reflect the Draft Updated CSO Control Plan cost model.[1]

[1]Cost, conveyance, tank sizing, and Somerville routing updates reflect the Draft Updated CSO Control Plan cost model (tab "MWRA_Costs") shared with Save the Alewife Brook by the MWRA, Cambridge, and Somerville CSO Project Planners on June 10, 2026.

1. Updated Cost: Approximately $701 Million

Adopting the Project Partners' Unit-Cost Calculations

At the June 10, 2026 meeting, the Project Partners shared their own unit-cost calculations for the Draft Updated CSO Control Plan. Save the Alewife Brook is adopting these calculations. Applying them across every component of the Community Plan brings the total estimated cost to **$701 million**, consistent with the Plan's description of itself as "achievable at a reasonable cost."

Plan Component	Cost ($M)	Assumptions
SOM001A (Somerville)	**242**	
Somerville Sewer Separation	100	Sewer separation (126 ac); cost does not include stormwater treatment and attenuation
Consolidated Pump Station (Somerville contribution)	33	Stormwater pumping required for 126 ac of sewer separation
Conveyance: Tannery Brook Conduit to Mass Ave SD	6	700 LF gravity pipe, 54 in. diameter (sized for peak flow, 25-yr 2050)
Somerville Master Plan, Sewershed CA, Alternative 2 (reroute to existing treatment facility)	92	Proposed flood-risk mitigation projects under Alternative 2 (new outfall scenario)
Somerville 10% GSI	11	10% of impervious right-of-way in Somerville's Alewife Brook area (12.18 ac)
CAM401A, CAM401B, CAM002, CAM001 (Cambridge)	**241**	
Cambridge Sewer Separation	193	188 ac of sewer separation (inconsistent with regional sewer-separation alternative)
Consolidated Pump Station (Cambridge contribution)	33	SW pumping for 108 ac (~80 ac assumed to drain by gravity into wetland)
Conveyance: Mass Ave SD to Consolidated SW Wet Well and PS	6	400 LF gravity pipe, 78 in. diameter (sized for peak flow, 25-yr 2050)
Cambridge 10% GSI	9	10% of impervious right-of-way in Cambridge's Alewife Brook area (10.10 ac)
MWRA	**93**	
MWRA Storage Tank at MBTA Station	68	Land acquisition acreage estimated from 2.7 MG tank, Mystic River Hybrid 1 Alternative
Dredging of Alewife Brook	25	
Stormwater GSI	**125**	
Constructed Wetlands	109	Priced as flow attenuation only; excludes stormwater treatment or land acquisition
Conveyance: Consolidated SW Wet Well and PS to Constructed Wetlands	16	2,200 LF force main, 48 in. diameter, including 200 LF complex Alewife Brook crossing
TOTAL	**701**	**Approximately $700 million**

Note: individual line items are Project Partner unit-cost estimates for the Draft Updated CSO Control Plan and are subject to further engineering refinement.

2. Added Stormwater Conveyance Pipes

The Addendum adds three new stormwater conveyance segments to move separated stormwater from Somerville and Cambridge to a consolidated pumping facility and onward to the new constructed wetlands. Each segment is sized for the peak flow of the 25-year, 2050 design storm, consistent with the Project Partners' engineering approach.

Conveyance Segment	Length	Cost ($M)	Design Notes
Tannery Brook Conduit to Mass Ave Storm Drain (Somerville)	700 LF	**6**	54 in. diameter gravity pipe, sized for the 25-yr 2050 peak flow
Mass Ave Storm Drain to Consolidated SW Wet Well and Pump Station (Cambridge)	400 LF	**6**	78 in. diameter gravity pipe, sized for the 25-yr 2050 peak flow
Consolidated SW Wet Well and PS to Constructed Wetlands	2,200 LF	**16**	48 in. diameter force main, including a 200 LF complex crossing of Alewife Brook
Total added conveyance	**3,300 LF**	**28**	

Together, these three segments carry separated stormwater from Somerville's Tannery Brook area and Cambridge's CAM401A sewershed to a shared pumping facility, then to the constructed wetlands for attenuation. This is the missing physical link between the two cities' sewer separation work and the Community Plan's Green Stormwater Infrastructure.

3. Somerville Solution Update: 126 Acres of Separation & Reroute SOM001A to an Existing CSO Treatment Facility

Somerville's 2022 Citywide Drainage and Water Quality Improvements Master Plan, prepared by engineering consultant Dewberry, includes "Sewershed CA Alternative 2," a set of projects that reroutes the Tannery Brook CSO (SOM-001A) to an existing CSO treatment facility instead of discharging directly to Alewife Brook.[2] Somerville Project Planners have already included comparable Dewberry Master Plan projects (Winter Hill / Ten Hills) in the Mystic River Updated CSO Control Plan,[3] confirming this approach is both technically and financially feasible.

Combined with **126 acres** of sewer separation, a consolidated pump station, new conveyance piping, and Green Stormwater Infrastructure, this reroute is part of the $242 million SOM001A program that eliminates CSO sewage discharges from Somerville at Alewife Brook, so that only stormwater reaches the Tannery Brook outfall.

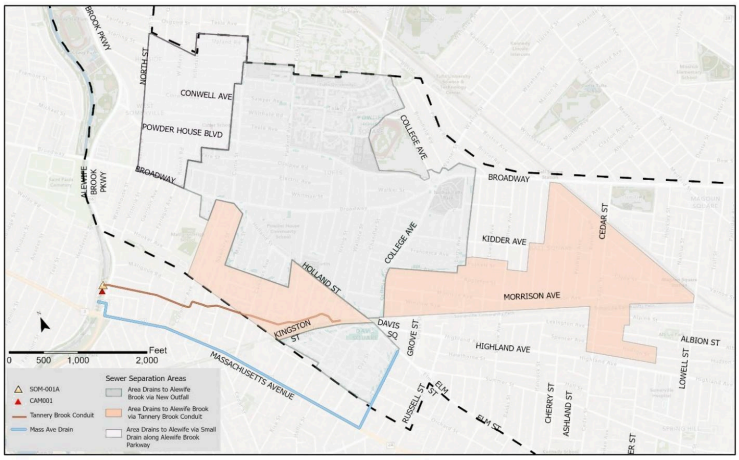

Figure 9-15. SOM001A Tributary Area with Sewer Separation Sub-areas

Figure 9-15. SOM001A Tributary Area with Sewer Separation Sub-areas, updated to 126 acres of sewer separation, highlighted in peach color. From the alternative presented to the MWRA Board of Directors, 02/04/2026.[4]

Plan Component	Cost ($M)	Assumptions
Somerville Sewer Separation (126 ac)	100	
Consolidated Pump Station (Somerville contribution)	33	
Conveyance: Tannery Brook Conduit to Mass Ave SD	6	
Sewershed CA Alternative 2: reroute SOM001A to existing treatment facility	92	New outfall scenario
Somerville 10% GSI	11	
SOM001A TOTAL	**242**

4. Legal and Policy Basis for the Community Plan

Three independent sources of authority support the Community Plan over the MWRA's draft plan. First, the Clean Water Act requires an evaluation of the full range of CSO control alternatives, and the Community Plan falls squarely within that range. Second, Massachusetts' Biodiversity Goals call for significantly reducing or eliminating CSOs through sewer separation and green infrastructure, which the Community Plan achieves and the MWRA's Alewife Plan does not. Third, MassDEP guidance directs that CSOs be eliminated through sewer separation wherever feasible, a standard the Community Plan meets and the MWRA's Alewife Plan does not.

The Community Plan received overwhelmingly positive responses when presented at a public forum in Cambridge attended by 171 community members on January 11, 2026.

Additional Options:

We are seeking further input from the Project Planners on the following options.

5. Connecting the Fully Separated CAM401A Sewershed to the MWR003 Storage Tank

At the June 10, 2026 meeting, the Project Partners raised an important concern: even after CAM401A is **fully separated** into distinct storm and sanitary sewers, CSO discharges may still occur. This is because sewer separation only accounts for approximately **90% of stormwater**. The remaining 10% enters the "separated" sanitary pipes anyway through **infiltration and inflow (I/I)**: groundwater and stormwater that leaks into aging sanitary pipes through cracked joints, deteriorated manholes, and illicit cross-connections.

That residual I/I flow can still surcharge the sanitary system during storms and cause CSO discharges at MWR-003, even with complete separation upstream.

This project alternative addresses this concern by piping the residual I/I flow from the fully separated CAM401A sewershed into the **MWR003 storage tank** at the MBTA Station site, so that it is captured and stored, then released to the treatment plant when the system has capacity, rather than discharged as an overflow. This keeps the benefit of full sewer separation in Cambridge while closing the I/I gap that concerned the Project Partners.

6. Right-Sizing the MBTA Station Storage Tank to a 25-Year Level of Control

The original Community Plan proposed a 3-million-gallon storage tank at the MBTA Alewife Station site, estimated at $30 million and roughly 7 years to construct. Once the tank must also absorb the residual I/I flow from the fully separated CAM401A sewershed (Section 3), it needs to be right-sized. Tanks are not easily expandable once built, so any tank must be sized for the largest flow it will ever need to hold.

This option right-sizes the tank to meet a **25-year level of control**, consistent with the Coalition to End Sewage Pollution's Shared Principles and Goals, for the combined flow from both CAM401A and MWR003. Reflecting the Project Partners' input, the tank's estimated cost is updated to **$68 million**.

Parameter	Original Community Plan	Addendum (Updated)
Flows served	MWR003 only	**MWR003 + fully separated CAM401A residual I/I flow**
Level of control	Not specified	**25-year storm event**
Estimated cost	$30 million	**$68 million**
Estimated construction time	7 years	**Under review with Project Partners**
